

Website Accessibility Assessments

Review this report to learn about accessibility problems, how to fix them to make your site more accessible to people with disabilities and mitigate your school district from lawsuits.

Your Accessibility Results

Web accessibility refers to the practice of ensuring websites are designed and developed so that people with disabilities can perceive, understand, navigate, and interact with them.

Address the errors and warnings to help make your website accessible.

79 Errors

46 Warnings

Errors by Types of Disabilities

Users with disabilities are impacted by accessibility issues in different ways depending on their disability. We've outlined the different errors we've identified and who they affect most.

Disability	Errors
Blind	63
Deafblind	63
Mobility	31
Low Vision	10
Color Blindness	9
Sighted Keyboard Users	1

Stats by Regulation

Regulation	Errors	Warnings	Passed
WCAG LEVEL A	36	3	303
WCAG LEVEL AA	9	39	64
WCAG LEVEL AAA	0	1	28
WCAG 2.1 AA	0	0	81
Section 508	6	2	61
Best Practice	28	1	776

Accessibility Test Results

YOUR SCORE **88 / 100**

The following section of the report includes the results of the various accessibility tests we've run on your web page.

Elements must only use allowed ARIA attributes
Using ARIA attributes in roles where they are not allowed can interfere with the accessibility of the web page. Using an invalid role-attribute combination will, at best, result in no effect on the accessibility of the application and, at worst, may trigger behavior that disables accessibility for entire portions of an application.

ARIA role must be appropriate for the element
Values assigned to WAI-ARIA role attributes must be valid. This means values must be spelled correctly, correspond to existing ARIA role values, and must not be abstract roles in order to correctly expose the purpose of the element.
